

Intelligent/cognitive Agents Applications for Pervasive Computing

**Using COGNET Human Modeling Capabilities for Pervasive
Applications**

Goals of COGNET Research...

- ◆ **Enable Cognitive Task Analysis of Human Problem-Solving in:**
 - ◆ Real-Time Systems and Problems
 - ◆ Multi-Tasking Jobs and Environments
- ◆ **Create Model that can:**
 - ◆ Describe human information processing in both cognitive and behavioral terms
 - ◆ Generate predictions of future behavior
 - ◆ Explain its decisions
- ◆ **Driven by Application Concerns, such as in:**
 - ◆ Simulations that predict (expert) human performance
 - ◆ Embedded models
 - ◆ Intelligent Assistants and Agents

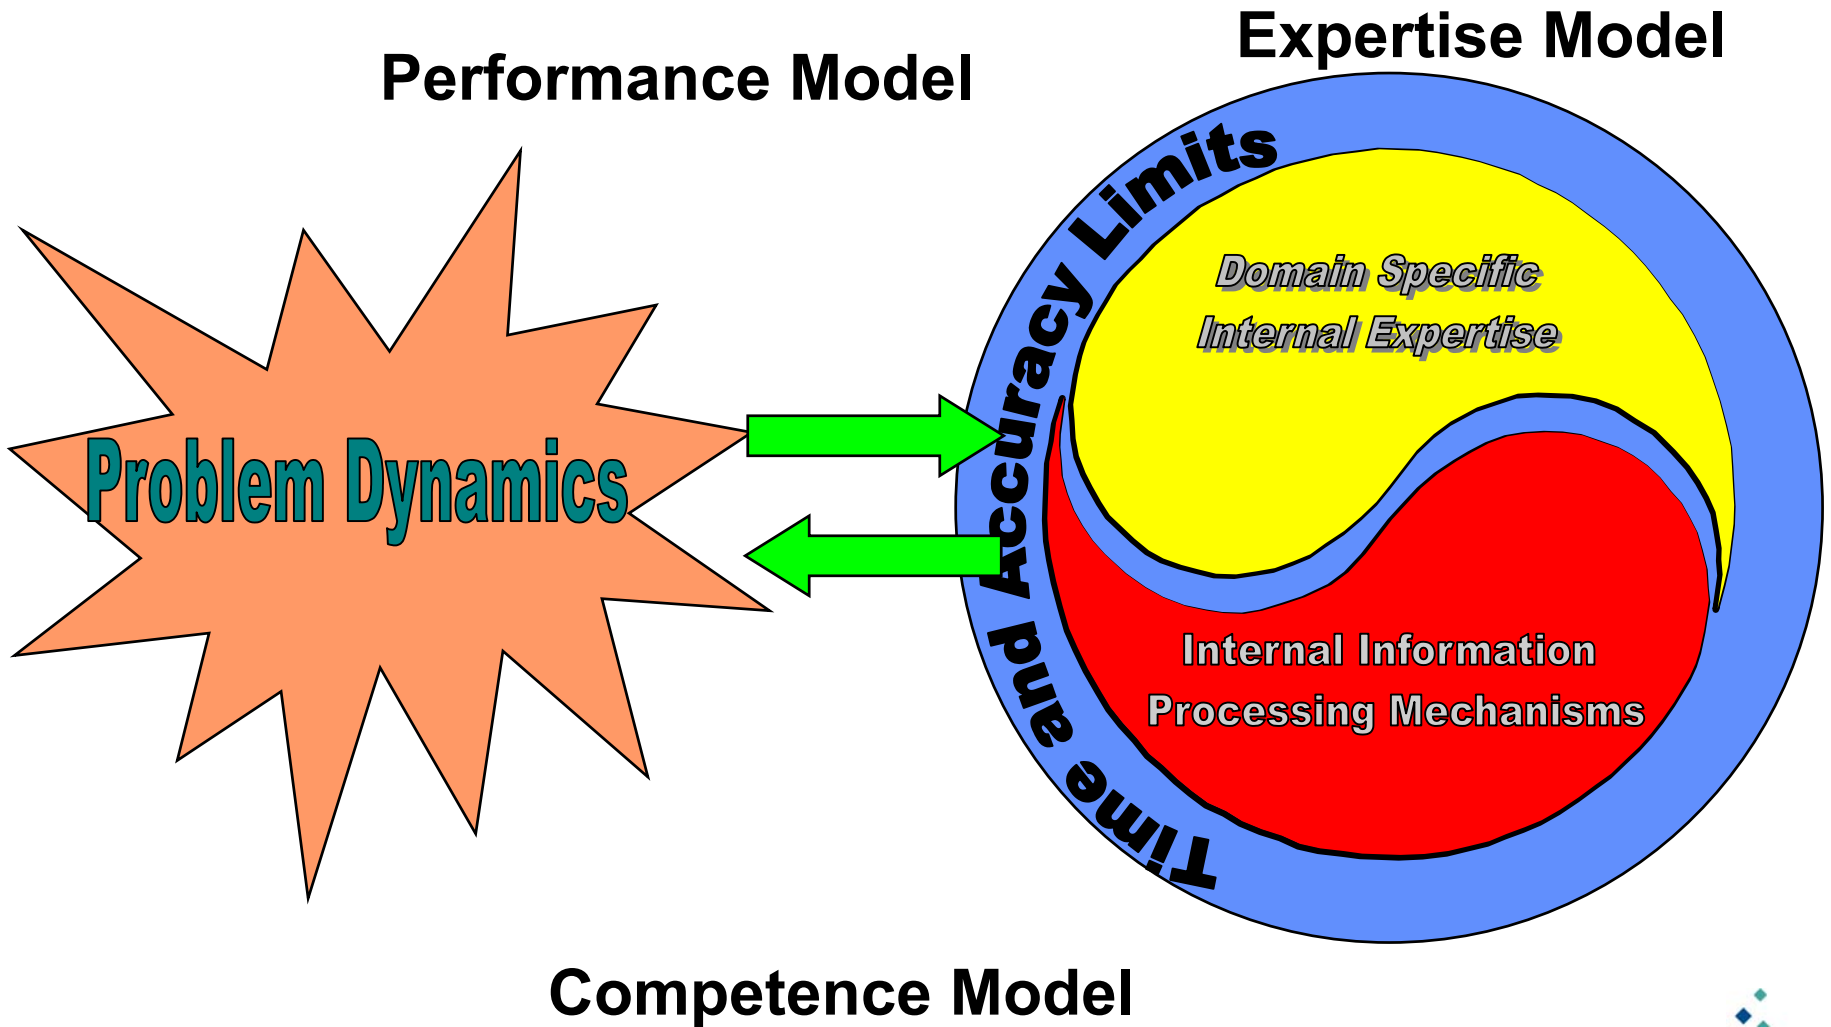

COGNET/iGENTM Framework

- ◆ **COGNET -- openly published, theory-based methodology to capture internal expertise**
- ◆ **CEL Description Language**
 - ◆ Formalism for representing domain-specific expertise
- ◆ **BATON -- underlying executable cognitive architecture**
 - ◆ to emulate internal processing mechanisms
 - ◆ highly portable and embeddable
 - ◆ extendable
 - ◆ C++ and Python Bindings
 - ◆ incorporated into iGENTM
- ◆ **iGENTM -- product that supports authoring, debugging, visualization and application of executable COGNET models**

What is a COGNET Model?

What does it consists of?

- ◆ **Declarative knowledge -- how to think about the world**
 - ◆ multi-panel blackboard, with semantic links
- ◆ **Procedural knowledge chunks -- how to do things**
 - ◆ compiled goal hierarchies
 - ◆ read and modify declarative blackboard
- ◆ **Perceptual demons -- how to make sense of what you see & hear**
 - ◆ self-activating encoding rules
- ◆ **Action knowledge -- how to manipulate things**
- ◆ **Meta-Knowledge -- attention flow**
 - ◆ Knowledge-applicability contexts (task triggers)
 - ◆ Situational priority
 - ◆ Metacognition

What can you do with cognitive agents?

- ◆ **Simulation**
- ◆ **Prototyping**
- ◆ **Training and Documentation**
- ◆ **Virtual Tutors**
- ◆ **Intelligent Human-Computer Interface and automation**

Training/Tutoring

◆ Training

- ◆ *how can you predict what knowledge trainees need to perform the correct actions?*
- ◆ *how can you diagnose what knowledge is missing when trainee actions are incorrect?*

◆ Virtual Tutors

- ◆ *what the user should do next?*
- ◆ *why should he/she do it?*
- ◆ *when should he/she do it?*
- ◆ *how should it be done?*
- ◆ *explanation across PC devices*

Human-Computer Interfaces

◆ HCI's

- ◆ *what information is needed at what times in the process?*
- ◆ *what interaction dynamics should be built into the interface?*
- ◆ *how can the HCI know what the user is doing?*
- ◆ *how can the HCI help the user perform work tasks?*
- ◆ *how does this differ for novices, experts? Different personalities?*

◆ System Evolution Planning

- ◆ *what knowledge of old systems can/should be transferred to new one?*
- ◆ *how can new system usage be engineered when there are no existing users?*
- ◆ *what are the cognitive requirements of the new system, given the problems experienced (and successes achieved) with the old?*

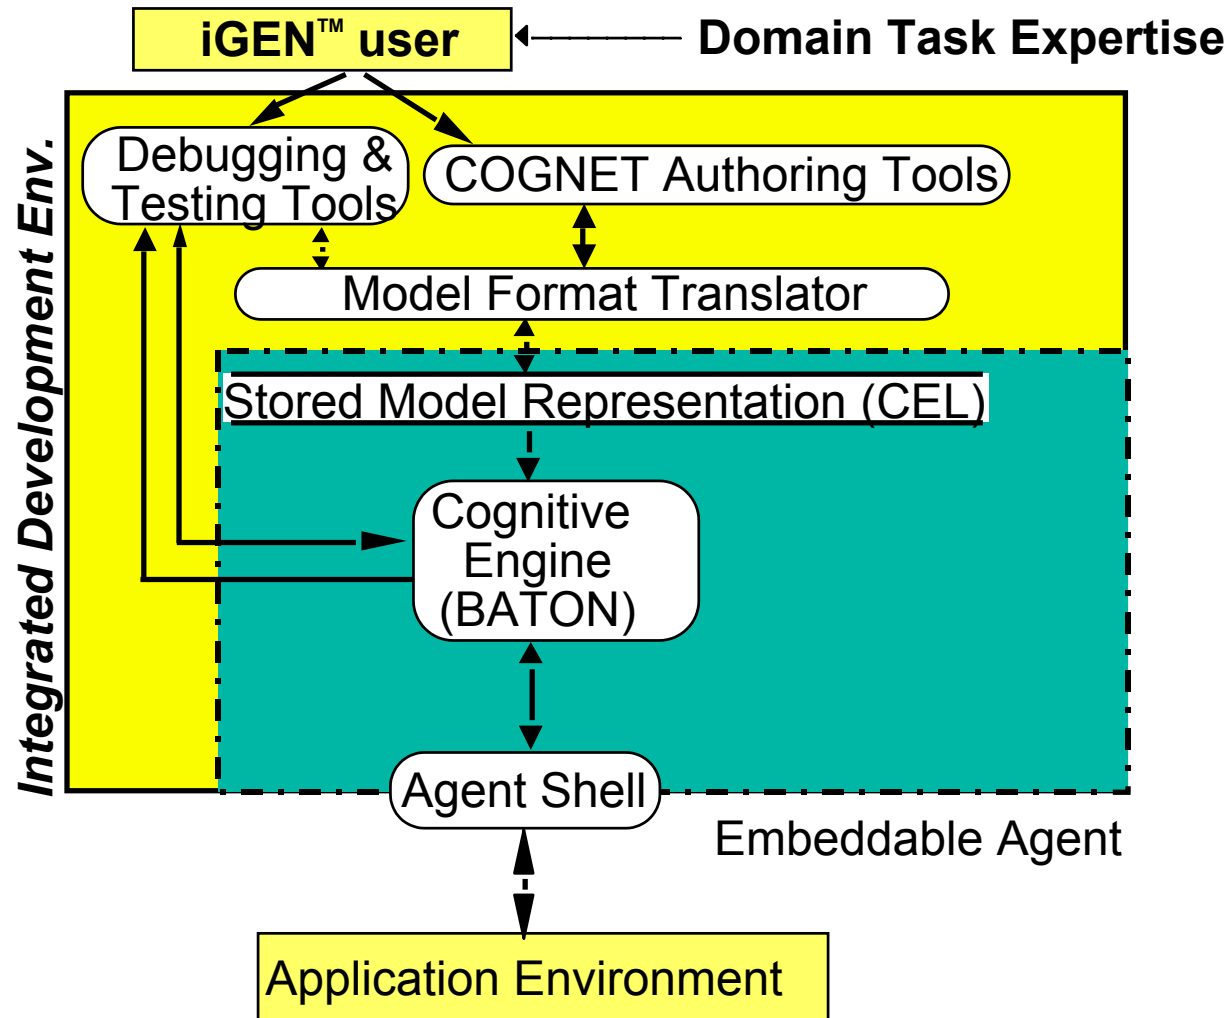

Simulation

how can we get simulated entities to behave realistically?

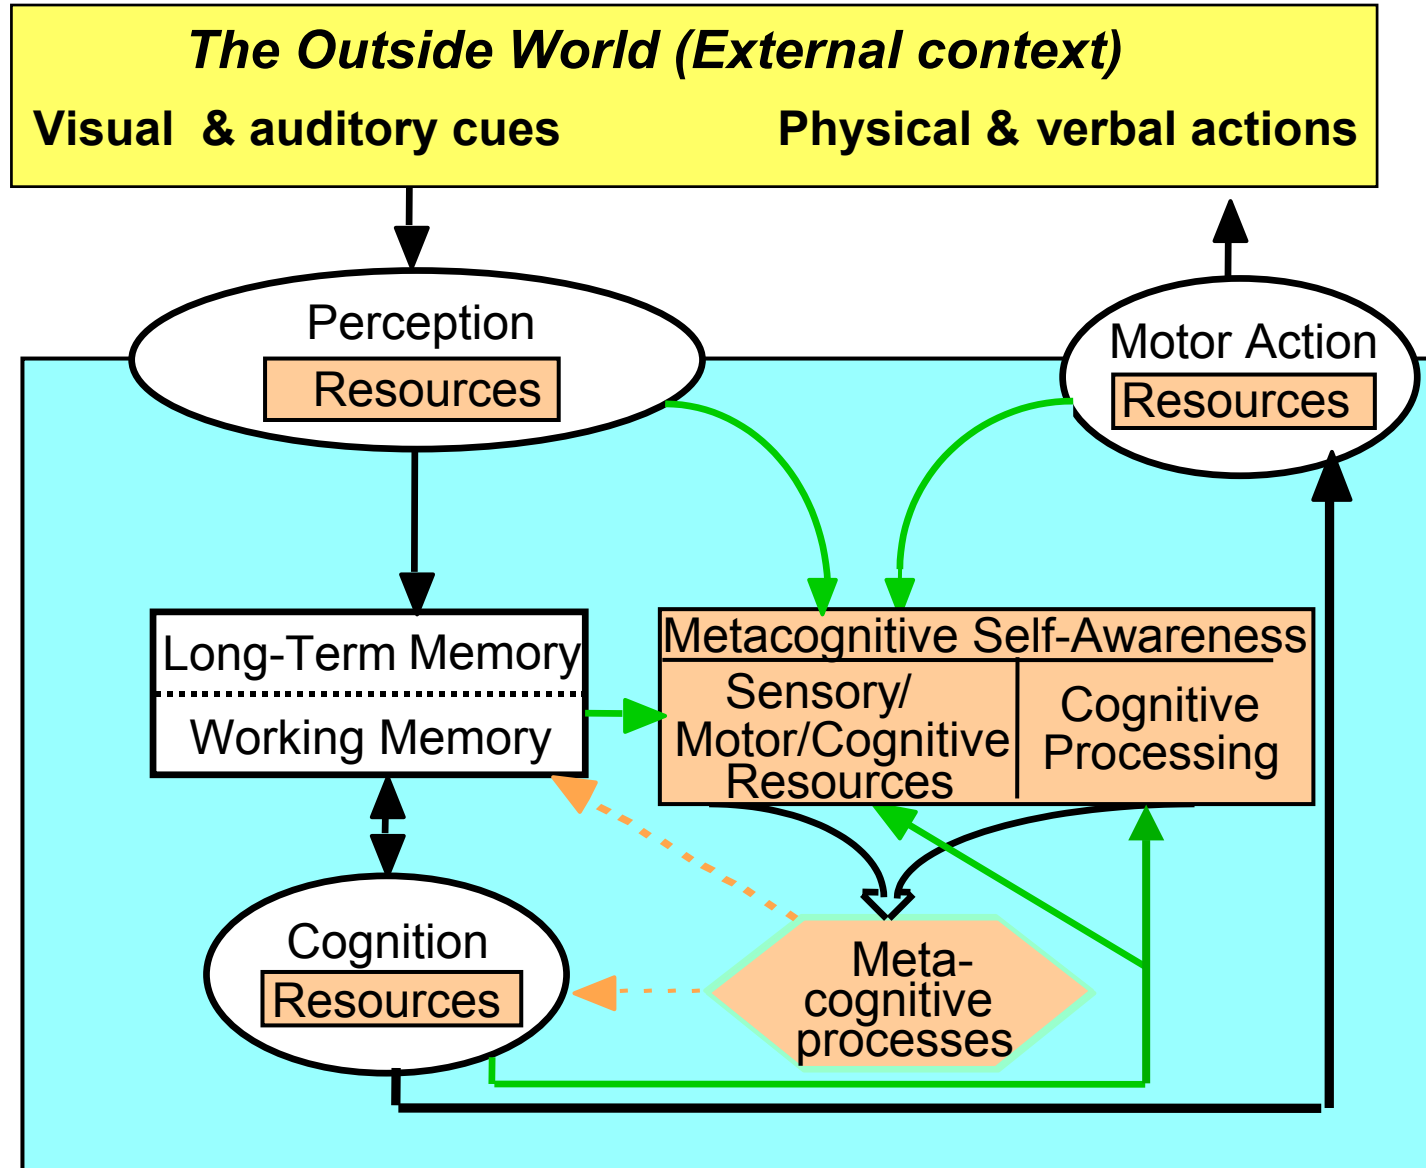

- ◆ **Sensory/Motor abilities**
- ◆ **Performance Models / Micro-models**
- ◆ **Memory moderators**
- ◆ **Metacognition / planning / failures**
- ◆ **Individual differences**
- ◆ **Representational scalability**
- ◆ *Learning*

The Development Workbench (iGEN™)

BATON Architecture

CGR: Cell Graphical Representation

- ◆ Visual language
- ◆ Context driven editing
- ◆ Only correct syntax
- ◆ Configurable for specific domains

EXiST (NIST) + COGNET

- ◆ **Developed in the frame of the NIST Aroma Project**
- ◆ **NIST EXperimental Simulation Tool (EXiST)**
 - ◆ Will help define use cases, requirements and measurements for Pervasive Computing
 - ◆ Simulator built around a real-time event engine
 - ◆ Uses measurements from experimentation to feed the simulation
 - ◆ Allows measurements to be combined to form more complex metrics
 - ◆ Will allow for the validation of conceptual models for pervasive computing such as NIST Layered Pervasive Computing (LPC) conceptual model
 - ◆ Modular Design
 - ◆ Developed in Python (simple development and integration of new modules in Python)

EXiST (NIST) + COGNET

- ◆ Using Cognitive Agents in Pervasive Computing
 - ◆ to assess PC:
 - ◆ They can emulate the human interactions during simulations and therefore help building viable business models of technologies
 - ◆ to create smarter Smart Spaces:
 - ◆ Expert Systems can help users using a Pervasive Computing environment
 - ◆ And learn from their interactions

Embedding BATON

Questions and Discussion
